JOSÉ ALBERTO HERNÁNDEZ MOYA

Full Stack Web Developer | C#/.NET · Python · JavaScript · SQL Server | OnBase Certified

Mexico City, Mexico | jahmpj@gmail.com | linkedin.com/in/josemoyacr | github.com/JoseMoyaCR

Based in Mexico City (GMT-6 year-round, no DST) — full working-day overlap with all US and Canadian time zones. Available for fully remote roles.

PROFESSIONAL SUMMARY

Full Stack Web Developer with 13+ years building, modernizing, and maintaining secure web applications on C#/.NET, JavaScript, and SQL Server for banking, insurance, and public-sector clients. Comfortable across the full legacy-to-modern range — ASP.NET Web Forms and MVC through .NET 10 — with hands-on database design, stored procedures, and performance-aware development. Uses AI-assisted development tooling (Claude Code, GitHub Copilot, OpenAI Codex) as an engineered workflow with versioned instruction files, verification hooks, and automated gates rather than ad-hoc prompting, and applies it to prototyping, refactoring, and code review. Consistent delivery under regulatory constraints: electronic-invoicing compliance, national digital-signature integration, and end-of-life security remediation on mission-critical systems.

TECHNICAL SKILLS

Languages: C#, T-SQL, JavaScript, TypeScript, Python, Java, VB.NET

.NET & Web: ASP.NET Web Forms (ASPX), ASP.NET MVC, .NET Framework / .NET Core / .NET 10, Razor Pages, REST APIs, ADO.NET, Entity Framework, Dapper, LINQ, SignalR

Front-End: JavaScript (ES6+), jQuery, TypeScript, Kendo UI (Telerik), Bootstrap, HTML5, CSS3, responsive design

Databases: SQL Server — relational database design, stored procedures, query optimization, indexing and performance-aware development, telemetry schema design

Python: Backend scripting, automation, integrations, data analysis, prototyping, device-side tooling for embedded systems

Code Quality & Security: Unit testing, regression and mutation testing, code review, SOLID, Clean Code, design patterns, parameterized queries and SQL injection prevention, authentication hardening, SQL Server security, end-of-life remediation

AI-Assisted Development: Claude Code, GitHub Copilot, OpenAI Codex — versioned instruction files (CLAUDE.md / AGENTS.md), pre/post-execution verification hooks, reusable skill libraries, gate-based agentic workflows for prototyping and refactoring

DevOps & Cloud: Git, CI/CD, Scrum, code review practice, AWS EC2 / VPC, Linux (Ubuntu Server)

ECM & Automation: OnBase Workflow (Hyland Certified), UiPath, Jidoka, Appian

Domains: Banking, Insurance, Financial Cooperatives, Public Sector, Regulated Compliance, Document Capture

Currently developing: Angular, Azure DevOps, OWASP-aligned secure coding (formal application-security coursework in progress)

WORK EXPERIENCE

Development Supervisor & Full Stack Engineer | SEA Servicios Múltiples
Remote from Mexico City | Jul 2025 – Present

- Own hands-on technical direction for DocumentPipelineAI, an automated document-capture platform built on .NET 10, Dapper, and SQL Server, while supervising a team of 5 engineers and setting delivery and code-review standards.
- Run day-to-day development through an engineered AI-assisted workflow — versioned instruction files (CLAUDE.md / AGENTS.md), pre- and post-execution verification hooks, a reusable skill library, and agentic loops across Claude Code and OpenAI Codex — used for functional prototyping, refactoring, and review acceleration.
- Cut per-page processing latency ~22% (≈59s to ≈46s) by root-causing three configuration and implementation defects, and diagnosed an availability failure originally attributed to the network, proving the real cause was a default HTTP client timeout silently overriding the configured value; locked the correction with a mutation-verified regression test.
- Designed and implemented caching and fast-path gates — native-text detection, per-page SHA-256 content hashing, and a cache key bound to content plus processing version — resolving roughly 40% of requests without invoking the expensive path.
- Built a per-invocation telemetry schema in SQL Server and used the measured data to redirect optimization effort, showing that the component assumed to consume ~42% of per-page time actually consumed ~76%.

Full Stack Engineer | Scotiabank
San José, Costa Rica | Nov 2022 – Jun 2025

- Maintained and enhanced SGC, the customer case-management web application used across Scotiabank Costa Rica's full branch network, implementing segmented notification parameterization so client communications could be targeted by customer segment.

- Drove the software-currency modernization of SGC — migrating the SQL Server database, Windows Server infrastructure, and .NET runtime to supported versions while hardening security controls — removing end-of-life compliance risk on a mission-critical, branch-facing system.
- Led the Quickpass upgrade to Costa Rica's Factura Electrónica 4.0 standard (Ministerio de Hacienda), meeting the regulatory enforcement deadline with no interruption to tax-document operations.
- Contributed to the Java modernization of Insures XXI (Java 8 / WebSphere to Java 17 / TomEE) supporting insurance operations, collaborating with distributed squads across Costa Rica, Mexico, and Canada under Scrum, with code review and pairing in a bilingual delivery environment.

Tech Lead & Full Stack Developer | SEA Servicios Múltiples
San José, Costa Rica | Aug 2017 – Oct 2022

- Led a team of 5 engineers under Scrum across concurrent engagements for financial cooperatives and public-sector clients, working directly with customers to clarify requirements, estimate solutions, and commit to delivery dates.
- Designed and delivered ControlPAS end-to-end for Costa Rica's Ministerio de Seguridad Pública and RACSA (state-owned telecom): ASP.NET web portal, SQL Server data layer with stored procedures, SignalR real-time notification, and the supporting OnBase document workflows.
- Engineered ControlPAS's integration with Banco Central de Costa Rica digital-signature infrastructure, building a custom signing component that made government resolutions legally binding and raised the system to national digital-signature compliance.
- Architected and implemented OnBase credit-origination workflows for Coopeande and Coopealianza — two of Costa Rica's largest financial cooperatives — automating document capture, routing, and approval across the loan lifecycle.
- Built an SMS campaign management and automation platform with real-time delivery tracking, integrating carrier services with an ASP.NET front end and SQL Server back end.

Full Stack Developer | RegionalSoft
San José, Costa Rica | Jun 2013 – Jul 2017

- Built and maintained ASP.NET web applications, including a responsive public-facing site with SEO optimization and dynamic data visualization.
- Led the Windows 10 migration of a desktop product and extended the FileMaster product with new modules, improving stability and data integrity through validation and referential-integrity controls.

SELECTED PROJECTS

AI-Assisted Development Harness — internal engineering tooling

Built a reusable agentic development harness used daily across .NET work: versioned instruction files, permission and verification hooks, a custom skill library, and gate-based workflows separating specification, implementation, and review. Purpose is repeatable, auditable AI-assisted delivery — prototypes and refactors that are verified rather than trusted.

Embedded Systems & Python Tooling — Universidad Fidélitas program (2024)

Developed microcontroller firmware and host-side Python automation and data-handling scripts, covering serial protocol communication and device-to-application integration. Python has been the language used for scripting, automation, and data analysis work throughout this and adjacent projects.

CERTIFICATIONS

- OnBase Certified Workflow Engineer for Partners — Hyland (Oct 2024)
- Certified Scrum Master — MAPO (Sep 2018)
- Microsoft Certified Professional (MCP) — Microsoft (May 2014)

EDUCATION

- Systems Engineering (in progress) — Universidad Americana (UAM), Costa Rica
- Embedded Systems Technician — Universidad Fidélitas (2024)
- Creative UX/UI Specialization — Universidad Véritas (2021)
- Mobile Development (Xamarin) — Universidad Cenfotec (2020)

LANGUAGES

Spanish — Native | English — Professional working proficiency (B1: fluent written and technical communication; comfortable in day-to-day spoken collaboration) | Portuguese — Basic
